sessions.ai

# Real-time AI-Driven Meeting OS

Meetings are stuck in 2013.

— They don't understand anything.
— They don't remember anything.
— They don't connect to your workflow.

After every meeting:

— context dies in 10 minutes
— decisions evaporate
— tasks get lost
— teams re-explain the same topics again and again
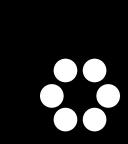

This model is dead.

AI finally makes real-time understanding possible.

— Real-time LLMs
— Semantic topic detection
— Instant knowledge extraction
— Zero-latency UX → cognitive layer appears

Introducing sessions.ai

The first Operating System for Team Conversations.

no "summary app".
no "recording tool".
no "Zoom plugin".
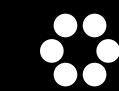

→ A real-time intelligence layer that thinks with your team.

Speak. Sessions.ai structures everything.

— Active topics
— Decisions forming
— Clarifications
— Risks & blockers
— Action drafts
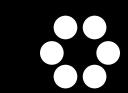

The meeting finally understands itself.

A clean, actionable output — instantly.

— Episode timeline
— Key decisions
— Actionables (human-reviewed)
— Links to context
— Team knowledge is auto-organized

The meeting finally understands itself.

A workspace that maintains itself.

— Actionables auto-grouped into workstreams
— Fragments (micro-insights)
— Zero setup
— No Kanban hell
— No task-manager babysitting

Work happens naturally. Organization becomes automatic.

Why We Win

1. Real-time, not post-factum
Nobody does true real-time understanding.

2. Zero-friction onboarding
1 click → session → structured output.

3. AI-driven Workspace
Not a summary tool — an operational layer.

4. Designed to replace outdated workflow tools
Zoom + Notion AI + Jira → unified.

5. Future moat: AI Teammates
Personalized virtual roles with full team context.

Start your first Session.
Let the OS handle the rest.
